The gene can, therefore, be used to predict the susceptibility of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    which regulates expression of the beta2NR gene. The polymorphism is thought to affect individuals, responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity dishates regular disease, ischemic heart disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5 leader sequence, which encodes a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 20 BP; 1 A; 6 C; 11 G; 2 T; 0 other;

                                                                                  antirheumatic, antisclerotic, antidiabetic, antiinflammatory, cytostatic, antirheumatic, neuroprotective and antimicrobial activity and may be useful in gene/protein therapy, vaccines, modulation of the expression and activity of proteins related to angiopoietin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHC) class I histocompatibility antigen and/or phosphoglygerate kinase. Disorders that may be prevented, diagnosed and/or treated by the above methods include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erytheromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukemia) diseases of the nervous system, an infection of pathogenic organisms. They may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to nucleic acids (AAH79386-AAH80036) encoding polymorphic variants of proteins (AAG98010-AAG98238) related to angiopoietin, 4-hydroxybutyreins (dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHC) class I histocompatibility antigen and/or phosphoglycerate kinase. These nucleic acid single nucleotide polymorphisms (SNPs) and the encoded
                                      be used to alter phenotypic traits such as longevity, appearance, strength, speed and endurance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             proteins have potential immunosuppressive, immunostimulatory,

                                   This sequence encodes the protein of the invention. The protein of the invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 1251-cyanopindrol. The protein can be used is screening for agonists and antagonists, which are useful in researching

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAT93250 standard; cDNA to mRNA; 1999 BP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 230 BP; 42 A; 91 C; 70 G; 27 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful for therapeutic regulation of gene expression, such as in cases of neurodegeneration; stroke; cardiovascular disease; hypertension; cancer; inflammation; metabolic disorders (obesity and diabetes) and bacterial or viral infection. The present sequence is one of gene fragments of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           modification of post-transcriptional protein expression in eukaryotic cells may be carried out through the targeting specific interactions of proteins that bind to RBPs. The gene fragments of the invention are used to identify their optimized sub-fragments, compounds that affect RNA/RBP interaction or mRNA functionality; or RBPs that interact with the compounds. Compounds identified using the gene fragments are potentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               where the corresponding mRNA fragment has RNA binding protein (RBP) binding activity. RBPs mediate the processing of pre-mRNA, the transport of mRNA from the nucleus to the cytoplasm, mRNA stabilisation, translational efficiency, and the sequestration of some mRNAs. Therefore modification of post-transcriptional protein expression in eukaryotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention, isolated from the human beta-2 adrenergic receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            191 GGCTGGGGGGCGCCTCAGCGG 172

         The present sequence is a fragment of the C allele of the human beta2 adrenergic receptor (beta2AR) gene, which is located on chromosome 5931 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension,
congestive heart failure, ischemic heart disease, arrhythmia, obesity
                                                                                                                                                                                                                                           Polymorphisms in the leader cistron (LC) of the beta 2-adrenergic receptor (beta 2 AR), useful for predicting genetic disposition to a disease modified by beta 2 AR expression e.g. congestive heart failure,

                      This cDNA sequence codes for human beta-2-adrenergic receptor (see AAW75777) having an arginine residue at position 16. A novel metho for identifying individuals susceptible to adverse responses to regular administration of beta-agonists comprises: (a) identifying in a genomic nucleic acid sample from the individual first and second alleles of the beta 2-adrenergic receptor gene, and (b) classifying an individual as susceptible if first and second alleles both encode Arg at residue 16 of the beta 2-adrenergic receptor protein. Beta 2-adrenergic receptor gene alleles may be
                                                                                                                                                                                                             Diagnosing asthma patients predisposed to adverse beta-agonist reactions upon regular administration - by identifying patient homozygous for allele encoding Arg at position 16 of beta2-adrenergic receptor protein
                                                                                                                                                                                  Disclosure; Page 33-35; 46pp; English.

The invention identifies a known polymorphism in the beta 2-adrenergic receptor gene as being linked
                                                                                                                          30-DEC-1997;

                                                                             Matches
                                                                                                                Query Match
                                                                                                                                                                                       determined. The beta 2-adrenergic receptor sequence variants can be used to develop therapeutics and/or lifestyle drugs. Individual specific beta 2-receptor agonists can be developed. Treatments can be optimized for individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AAZ00773.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including myocardial infarction and stroke, other conditions that can be

or migraine, allergic conditions, e.g. asthma and atopic disorders, and metabolic illnesses, e.g. morbid obesity including predicting a change in weight, using body mass index, can also be determined. The beta 2-adrenergic receptor sequence variants can be used to develop therapeutics and/or lifestyle drugs. Individual specific beta 2-receptor agonists can be developed. Treatments can be optimized for individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents the wild type human beta 2-adrenergic receptor gene which is described in the method of the invention.
                                                                                                                                                                   Sequence 3451 BP; 790 A; 873 C; 895 G; 893 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             myocardial infarction and stroke. Other conditions that can be determined include neuropsychiatric disease, such as depression, anxiety, attention deficit disorder with hyperactivity, eating disorders, e.g. anorexia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         autonomous nervous system, e.g. Bradbury-Eggleston, Sky-Drager and Riley-Day syndromes having selective noradrenergic-receptor disposition,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nervosa and bulimia, or post-traumatic stress disorder. Diseases of the

The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers for detecting the beta2AR gene polymorphisms. The beta2AR gene polymorphisms are useful in studying the expression and biological function of beta2AR, and for developing drugs targeting this receptor. They are also useful for the state of the st

migraine, anaphylaxis and chronic obstructive pulmonary disease (COPD) The gene can, therefore, be used to predict the susceptibility of an individual to these diseases and determine the best treatment.
                                                                                                                                  beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, diabetes, vascular disease, premature labour,
                                                                                                                                                                                                                  which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and

Pairs of oligonucleotides for amplifying adrenergic receptor genes

Disclosure; Fig 2; 58pp; English.

This sequence represents the human beta2-adrenergic receptor gene, and is amplified by the primers of the invention. The primers are non-self hybridising; contain at least 15 nucleotides (nt) and has a melting temperature 50-85 deg. C. Each pair of primers is: non-cross-hybridising; anneals to two distinct segments (separated by at least 400 nt); and

Polymorphisms in the leader cistron (LC) of the beta 2-adrenergic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
or more polymorphic positions within these genes, and comparing the pattern of polymorphisms from the individual with a reference polymorphic
                                                                      status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACE), angiotensin II receptor type 1 (ATI) and type 2 (ATI2), angiotensinogen (AGT), renin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                prostatic disease (hypertrophy), and those in the beta2 gene with cardiovascular disease, hypertension and asthma, but variations may also be associated with peripheral vascular, pulmonary, neuropsychic and endocrine-metabolic disorders. These primers allow rapid and specific amplification of large and homogeneous gene segments of the alphalB and beta2 genes from a complex mixture of DNAs. This makes possible detection
                                  aldosterone synthase, endothelin receptor type A and beta-adrenergic receptors 1 and 2. The method comprises determining the sequence at one
                                                                                                                                                                          Disclosure; Page 124-125; 126pp; English.
                                                                                                                                                                                                                                 Assessing cardiovascular status in humans involves comparing test polymorphic pattern comprising polymorphic positions within genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Beta-adrenergic receptor-2 gene; coding region; polymorphism; polymorphic marker; cardiovascular disease; myocardial infarction; unstable angina; hypertension; ath
                                                                                                                                     The invention relates to a novel method of assessing the cardiovascular

Adverse results in an early trial can be evaluated to identify polymorphic patterns so that the adverse results can be correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial drugs can be approved for use in the appropriate population, thereby decreasing the number of patients required for a clinical trial, which in

The present sequence represents the human beta-adreneryic receptor-2 gene coding region (GenBank Y00106/g293708). The polymorphic sites identified are 839A/G, 872C/G, 1045A/G, 1284C/T, 1316A/C, 1846C/G, 2032A/G,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fragments of the genes comprising a polymorphic site may be used as primers and probes for detecting genetic polymorphisms or in molecular library arrays for high throughput screening. The genes, and the proteins they encode are useful in the screening of potential cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (e.g., ACE inhibitors, beta-adrenergic receptor antagonists (beta-blockers) or calcium channel blockers). One or more polymorphic markers provides a basis for predicting the outcome of a treatment regimen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cardiovascular disorders such as myocardial infarction, unstable angina, hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular status of a patient given a

individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AAZ00773.
                                                                                                            disposition, or migraine, allergic conditions, e.g. asthma and atopic disorders, and metabolic illnesses, e.g. morbid obesity including predicting a change in weight, using body mass index, can also be determined. The beta 2-adrenergic receptor sequence variants can be used to develop therapeutics and/or lifestyle drugs. Individual specific beta 2-receptor agonists can be developed. Treatments can be optimized for individual specific beta
                                                                                                                                                                                                                                                             attention deficit disorder with hyperactivity, eating disorders, e.g. anorexia nervosa and bulimia, or post-traumatic stress disorder. Diseases of the autonomous nervous system, e.g. Bradbury-Eggleston, sky-Drager and Riley-Day syndromes having selective noradrenergic-receptor
                                                                                                                                                                                                                                                                                                                                                                                    immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including myocardial infarction and stroke. Other conditions that can be
                                                                                                                                                                                                                                                                                                                                                               determined include neuropsychiatric disease, such as depression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and

The gene has two different alleles, and it has been shown that the presence of two copies of the Tallele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, diabetes, vascular disease, premature labour, migraine, anaphylaxis and chronic obstructive pulmonary diseases (COPD). The gene can, therefore, be used to predict the susceptibility of an
               diseases and infections
                             Polymorphic nucleic acids encoding e.g. angiopoietin, dehydrogenase, adenosine triphosphate-dependent RNA helicase and/or phosphoglycerate kinase, useful for diagnosing and treating, e.g. cancer, autoimmune

                                  This sequence encodes the protein of the invention. The protein of the invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 1251-cyanopindrol. The protein can be used in screening for agonists and antagonists, which are useful in researching
                                                                                                                   Disclosure; Page 27-30; 47pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          modification of post-transcriptional protein expression in eukaryotic cells may be carried out through the targeting specific interactions of proteins that bind to RBPs. The gene fragments of the invention are used to identify their optimized sub-fragments, compounds that affect RNA/RBP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         where the corresponding mRNA fragment has RNA binding protein (RBP) binding activity. RBPs mediate the processing of pre-mRNA, the transport of mRNA from the nucleus to the cytoplasm, mRNA stabilisation, translational efficiency, and the sequestration of some mRNAs. Therefore
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 230 BP; 42 A; 91 C; 70 G; 27 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inflammation; metabolic disorders (obesity and diabetes) and bacterial or viral infection. The present sequence is one of gene fragments of the

           The present sequence is a fragment of the C allele of the human beta2 adrenergic receptor (beta2AR) gene, which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension,
                                                                                                                                                                                                                                                                                                                                                                               Polymorphisms in the leader cistron (LC) of the beta 2-adrenergic receptor (beta 2 AR), useful for predicting genetic disposition to a disease modified by beta 2 AR expression e.g. congestive heart failure,
